

TXT2TAGS SAMPLE

Aurelio Jargas

Introduction

Welcome to the txt2tags sample file.

Here you have examples and a brief explanation of all marks.

The first 3 lines of the this file are used as headers, on the following format:

```
line1: document title
line2: author name, email
line3: date, version
```

Lines with balanced equal signs = around are titles.

Fonts and Beautifiers

We have two sets of fonts:

The NORMAL type that can be improved with beautifiers.

The TYPEWRITER type that uses monospaced font for pre-formatted text.

We will now enter on a subtitle...

Beautifiers

The text marks for beautifiers are simple, just as you type on a plain text email message.

We use double *, /, - and _ to represent **bold**, *italic*, ~~strike~~ and underline.

The ***bold italic*** style is also supported as a combination.

Pre-Formatted Text

We can put a code sample or other pre-formatted text:

```
here is pre-formatted
//marks// are **not** ``interpreted``
```

And also, it's easy to put a one line pre-formatted text:

prompt\$ ls /etc

Or use `pre-formatted` inside sentences.

More Cosmetics

Special entities like email (duh@somewhere.com) and URL (<http://www.duh.com>) are detected automagically, as well as horizontal lines:

You can also specify an **explicit link** with label.

And remember,

A TAB in front of the line does a quotation.

More TABs, more depth (if allowed).

Nice.

Lists

A list of items is natural, just putting a **dash** or a **plus** at the beginning of the line.

Plain List

The dash is the default list identifier. For sublists, just add **spaces** at the beginning of the line. More spaces, more sublists.

- earth
 - america
 - ★ south america
 - ▷ brazil
 - how deep can i go?
 - europe
 - ★ lots of countries
- mars
 - who knows?

The list ends with **two** consecutive blank lines.

Numbered List

The same rules as the plain list, just a different identifier (plus).

1. one
2. two
3. three
 - mixed lists!
 - what a mess
 1. counting again
 2. ...
4. four

Definition List

The definition list identifier is a colon, followed by the term. The term contents is placed on the next line.

orange a yellow fruit

apple a green or red fruit

other fruits

- wee!
- mixing lists
 1. again!
 2. and again!

Tables

Use pipes to compose table rows and cells. Double pipe at the line beginning starts a heading row. Natural spaces specify each cell alignment.

heading 1	heading 2	heading 3
cell 1.1	cell 1.2	cell 1.3
cell 2.1	cell 2.2	cell 2.3

Without the last pipe, no border:

heading 1	heading 2	heading 3
cell 1.1	cell 1.2	cell 1.3
cell 2.1	cell 2.2	cell 2.3

Special Entities

Because things were too simple.

Images

The image mark is as simple as it can be: `[filename]`.

- The filename must end in PNG, JPG, GIF, or similar.
- No spaces inside the brackets!
